"Email Parser" is an excellent little program that takes a plain text email and outputs to a SQL table. It is much more useful than some other email to sql converters I have seen because this one takes the plain text and parses it based on a regex. Just got it and so far it's been working great for my purposes. I can get the plain text out of my email and just run a regular expression on it. Hope this helps some others looking to do the same thing. This program does not include the ability to parse the info of the attachments included in the email. Awesome App. I have used it to convert the PDF of the completed Engineering Draft into a database for future queries. It works very well on Gmail's attachments, and appears to parse more reliably than the gMailtoDB option. For future reference: 1. to parse attachments within an email, use either "open gmail to DB" or "paste the attachment and run the script" 2. for attachments within emails without a file, the regular expression ("\\r \\r ") will not capture the contents of the email body
