AutoCAD is regarded as a much more flexible and versatile CAD program compared to the desktop drafting programs that were previously available. It also provides some of the most powerful modeling, rendering, and database capabilities available in any CAD program. AutoCAD is the standard for architectural, mechanical, electrical, and structural drafting and design. Useful AutoCAD features include: - 3D modeling - Drawing and annotation - Geometry, cross-referencing, and editing - Filters and effects - Offset, cut, and copy/paste - Rendering and rendering-related tasks - Tracing - Utilities - Layouts - Data exchange - Revisions - Multiple platforms - Multiple language support - Interoperability - Extensibility - Exporting to PDF, SVG, DWG, DWF, DXF, HTML, and DWF - Interoperability - Interoperability - Database User Interface - AutoCAD can be operated via a standard keyboard, touchscreen, or mouse. - AutoCAD is keyboard-centric. - A keyboard is used for most functions. - AutoCAD includes predefined keystrokes and templates to aid in command execution. - Predefined keystrokes are defined in AutoCAD for functions such as toolbars, creating sheets, drawing-related functions, and menu items. - Common templates such as dimension, annotation, linetype, and linetype fill are also included. - Also included are predefined shortcuts to common commands, workflows, and AutoCAD features. - The command line also offers the same template functionality as AutoCAD's predefined keystrokes and templates. A Brief History of AutoCAD The first commercially available version of AutoCAD was AutoCAD R13, released in November 1984. When AutoCAD was first released, it was geared primarily towards professional mechanical designers. AutoCAD R13 lacked many of the features later introduced in AutoCAD 2.0, although it had many of the features introduced in AutoCAD R12. These included per-object linetypes and the ability to create dimensions, including unequal distances. AutoCAD R12 was considered "Pro" because it was only available for the Apple

In an extraordinary revelation, the government's own report on the CIA's torture program finds the program may have caused "more long-lasting damage than previously acknowledged." As the Washington Post reports, the assessment, made in June, shows that detainees at the agency's secret detention facility in Poland were deliberately waterboarded more than 3,000 times, despite the fact that the CIA banned waterboarding in 2002. As the Post's Dana Priest and Eric Schmitt point out, the document's author, the CIA's inspector general, found that the torture may have caused detainees to fabricate confessions. The report also found that the CIA misled Congress about its interrogation program. The report marks the first time the Obama administration has admitted that waterboarding was used in an interrogation program, and thus it also highlights the extent to which Obama administration officials and officials in Congress are still unaware of the program. In a statement on the report, CIA director John Brennan said the agency "admitted to using some enhanced interrogation techniques, some of which were previously

classified, that were not authorized by the United States government," according to the Post. This report, the Post says, may provide a "key opportunity" for the CIA to review its former detainees, but the report's release may not happen anytime soon. "The report has only just been turned over to the CIA. The agency is not expected to turn over a draft version of the report, much less release it, until next year at the earliest," the Post's Dana Priest and Eric Schmitt write. Is it possible to have different color palette in a MATLAB GUI? I know we can change the default palette using: `set(handles.axes,'ColorMap', colormap);` But I want to have two different palettes (let's say blue and white palette). Can we have different color palette for the GUI? If yes, how do I change the palette for a specific axer from the command line? A: You can use `set/get` to change the colors of a specific axis and `axes.colorbar` to change the color map for the colorbar. As the manual says, The color specification is a four-element vector that represents the RGB values of the color. so you can use a cell array, for example: `% change colors of a specific axis set(handles.axes, 'Color', {'red', 'green', 'blue', 'white'}); % change color map for the colorbar set(handles.axes, 'Color', {0.2, 0.6, 0.2, 0.6});` If you want to modify it programmatically (i.e. without using a GUI), then it's easier to use the winograd toolbox, which allows you to change the colors of axes and the colorbar directly from the command line.
