From an image-editing standpoint, Photoshop has superior editing tools. However, Illustrator is easier to use. But Photoshop has the image-editing tools that Illustrator doesn't have, and Illustrator has the tools that Photoshop doesn't have, especially for bitmap or vector images. As a vector-editing application, Illustrator helps create icons and other vector shapes with the great shapes functionality. Icons can be exported to any format supported by the operating system. In this chapter, I guide you through the process of using Photoshop to create icons, which are small, simple images. For more in-depth information about Photoshop and how to create icons, be sure to check out some of my books: Photoshop Revealed, Photoshop CS for the Complete Beginner, and Photoshop CS8 for the Complete Newbie. I also have a Photoshop tutorial book that you can buy on the CD included with the book, which comes in handy for those trying to figure things out without a book. How to Get Started The good news is that Photoshop is one of the most user-friendly applications out there. It is amazingly simple to use, and most of the features that create the headache that most people have in dealing with it are hidden from you. To start using Photoshop, choose Image⇒New to start the Photoshop file-naming wizard. Follow the onscreen instructions. This process creates a new Photoshop file in the folder you've selected. Photoshop automatically creates a file with the.psd format. You can also start a new image by clicking the File tab in the Tools panel of the Photoshop window and selecting New. Alternatively, you can navigate to the folder where the image file you want to create resides and select File⇒Open to open the file in the Photoshop window. The first time that you open a new image, you see the preview and a crop tool, as shown in Figure 1-2. **Figure 1-2:** When you first open a new image, you see the crop tool. After you create your image, choose Edit⇒Preferences to open the Preferences dialog box. Here are some of the options: Image Quality: Choose one of four quality settings: High, Medium, Low, or Highest. The default setting is Medium. A comparison of minimental and finger-tapping tests in stroke patients and normal volunteers. Patients with left-hemiparetic stroke and healthy subjects (unselected for either age or gender) were used to compare the performance on simple tasks in two test instruments: the minimental test (Mintex) and a finger-tapping (FT) test. The performance results indicated that in tasks in which MTI scores were correlated with FT scores, the correlation was either poor to moderate. In several performance parameters measured by the Mintex, healthy subjects (11 males and 6 females, ages 25-70) performed significantly better than patients with left hemiparesis (10 males and 9 females, ages 25-82). On a global performance rating scale, the Mintex and FT measures of stroke severity yielded similar results. Individual parameters obtained on the Mintex were also moderately correlated with four of the FT performance measures. We recommend that the Mintex be used to measure the severity of hemiparesis and that the FT be used to measure the motor recovery of patients.Exogenous chondroitin 4-sulfate improves symptomatic osteoarthritis of the knee: a placebo-controlled, randomized, double-blinded, clinical trial. The effects of 2 g daily of chondroitin 4-sulfate (C4S) were evaluated in 40 subjects with symptomatic osteoarthritis (OA) of the knee. Chondroitin sulfate (CS) has shown to reduce pain and improve knee function in subjects with symptomatic OA. To investigate if C4S is able to improve clinically relevant parameters of pain and knee function in OA patients. A double-blind, placebo-controlled, randomized study was performed. After randomization, patients were treated for 12 months with two daily doses of 2 g C4S or two daily doses of placebo. The primary outcome measure was a reduction in pain during walking at 3 and 12 months as measured with the Western Ontario and McMaster Universities Osteoarthritis (WOMAC) index. The secondary outcome measures were the WOMAC pain and function subdomain scores at 3 and 12 months and the Lequesne Index at 3 and 12 months. A total of 40 patients completed the study. At 3 and 12 months, the pain scores measured with the WOMAC index, WOMAC pain subdomain score, and Lequesne Index were significantly improved compared with baseline in the C4S group. Improvement in pain was significantly better
