Whether you're designing products, creating mechanical assembly drawings, or generating detailed shop drawings, AutoCAD Architecture can get the job done. AutoCAD Architecture gives you the power to do more than just draw. Create or import a 3D model of your mechanical assembly from a live BIM model, and then produce professional-looking drawings based on your model. You can also produce simple or complex drawings, from small and detailed shop drawings to large-scale architectural drawings. AutoCAD Architecture: 3D Modeling You can import a standard (ASE) or non-standard (NAE) 3D model into AutoCAD Architecture for creating mechanical assembly drawings. Use the model as an assembly model to provide accurate assembly line information, or use it as a component model to produce drawings with toolpath lines for machining. Once the model has been imported, you can attach assembly drawings to the model. Drawing objects in the model are scaled to the same size as the drawing in which they will appear. Select the Draw Views of Model command on the Insert tab to open the View Properties dialog box. This dialog box is used to specify the display options for the assembly model. Use the View Views of Model Type list box to select the views you want to use to display the assembly model, and then use the View Views of Model Options list box to specify options for the view. Select the Import Model command on the Insert tab to import a file containing the 3D model of your mechanical assembly

File AutoCAD allows the exporting of DWG and DXF files in the following formats: EPS AutoCAD supports PDF output as well as the more common formats CorelDraw, InDesign, Illustrator, QuarkXpress and Word. When used with the PDF converter, AutoCAD can convert a single layer drawing to a PDF document with a wide range of paper sizes and colors, and a variety of different glyph types, including paths, text, lines, and curves. PDF files can be created from any selected layers of a drawing and have a range of editing features, including paths, vectors, text, and raster images. PDF files can be sent from one computer to another, and can also be embedded into a wide range of electronic files. AutoCAD also supports exporting to a range of popular vector graphics formats, including Adobe Illustrator, Adobe InDesign, Adobe Photoshop, Adobe Fireworks, Autodesk Architectural Designer (AAD), Autodesk Civil Designer (ACD), Autodesk Total Design (ATD), CorelDRAW, Corel After Effects (AE), and Unified Modeling Language (UML). AutoCAD can also convert a DWG file to a portable Adobe Illustrator (.ai) or Autodesk Architectural Designer (AAD) file. The AI and AAD files can be opened in the popular Adobe Photoshop, Adobe Fireworks and InDesign applications. Since 2007, AutoCAD can also export to the HTML5 standard SVG format. This feature enables Web-based workflows, and makes it possible to share content with Internet Explorer users. SVG support in AutoCAD 2017 introduced the ability to save DXF, DWG, and PDF files with embedded hyperlinks, giving you access to the drawings on the web. AutoCAD.NET Component (ANC) Autodesk has released a COM.NET component for AutoCAD called the AutoCAD.NET Component (ANC), which allows the.NET application to read and write DWG and DXF files, as well as write data to Autodesk Exchange. Although it is not supported by all AutoCAD editions, it is available in AutoCAD 2011 and higher. The use of the ANC SDK is governed by a license. History AutoCAD was originally developed by Micrografx. At the time of the discontinuation of AutoCAD in 2003, the company had a1d647c40b

Enter it, now you are done, click on Ok 11. Now you can open your project and start modeling [13]. Another tool used to assess the mental health status is the PHQ-9 [21], with excellent psychometric properties [22]. The PHQ-9 is a nine-item instrument used to screen for depressive disorders in primary care patients. Each item is scored on a four-point Likert scale (0-3) with three response options, from "not at all" to "nearly every day". The overall score ranges from 0 to 27 and is based on the total number of symptoms scored as "present" and range from 0 to 27; where 0 indicates no distress, 1-4 indicates low distress, 5-9 indicates moderate distress, and 10 or more indicates severe distress. The PHQ-9 is a simple and easily applied instrument that takes approximately 5 minutes to complete. It is a valid and reliable instrument for depression screening in primary care and identifies patients with depression with a sensitivity of 88% and a specificity of 88% [22]. In the present study, the women reported a mean score of 13.42 ± 7.31 on the PHQ-9. This result was below the cut-off value of 16, which indicates the presence of depressive symptoms. Similar results were found by Siegel [21], where the women had a mean score of 12.6 ±
