What's New In Smart Battery Workshop?

In recent years the use of microprocessors has become widespread among average users. Most of them don't really understand the inner working of a computer and don't know how to handle the information stored in its various forms. The usual manner is to turn to the manufacturers or even the system's own administration to perform necessary system updates. Although this may be a proper solution for a corporate network, it doesn't have any good results if the computer is being used by the owner himself. The owners are the main target of the new program presented here. It is designed to help the owners of their personal computer to upgrade their systems' components, in order to make the life of the battery longer and to make it functional when the system is shut down. The program can be considered as an enhanced version of the original Smart Battery application. In fact, it allows you to reset the information stored in the EEPROM memory chip of the battery. There are other parts of the program that can help you to prolong the life of the battery. It includes the installation of drivers and tools necessary for preparing the notebook's hardware for operating the program. The program is not able to reset all the EEPROM chips but it includes a consistent list that you should check before starting to tinker with your laptop's battery. Although it provides some documentation for crafting the required tools, the program is clearly designed for the users with prior experience of handling EEPROM chips. You should be aware that some laptop batteries can be modified by simply using a Reset button and do not require this potentially complicated procedure. You should resort to this program only for the batteries do not have that feature. After dismantling the chip and connecting it to the adapter, you can change the contained information by using the Smart Battery Workshop. It includes the tools required to read the EEPROM memory and to write data to the chip. Before making any changes to the chip it is recommended to back up the information by dumping all the information to a file. If anything goes wrong with the operation you can always restore the information from the file.
