Q: Why would you need private members in an interface? Why would you need private members in an interface? Is it just for the example?

Example: namespace Test { interface ITest { private double myMember { get; set; } } }

A: Why would you need private members in an interface? Private and protected members are good for encapsulation and extending from a base class, but they're also good for testing, as you can encapsulate access. Consider: public class

```
ClassWithPrivateAndProtectedMembers { private double foo; protected double Bar { get; set; } protected double Baz { get; set; } }
```

The only way you can access foo is with an instance of ClassWithPrivateAndProtectedMembers. Bar and Baz can be made available to other classes, or to your test classes for instance. This pattern allows you to isolate private members of your class.
