11075049 Mandriva-cmpc-mini-2010-8.35-i586.rest.exe

A: You are writing a lot of code into a single variable. This is a common source of error in this language. Variable names should be short and descriptive. Long variable names are hard to read. (AKA: YAGNI) Like in C#

```
private Bitmap bmp = null; private MemoryStream ms = null; private StreamReader sr = null; private string fileName = string.Empty; private int bmpWidth = 0; private int bmpHeight = 0; private BitmapImage bi = null; private double tx, ty = 0; private int bytesPerPixel = 0; private int width, height, stride; private int gammatapplique, colorGreen, colorRhododendron, colorBlue, colorNavy, colorBrown; private float alphaR = 0; private float alphaG = 0; private float alphaB = 0;
```

Note that I have made sure that each variable is readable, meaning I have added single-line comments, meaningful variable names, and I have never included any name that was longer than about 6 words. I have also shorted the code down to keep it in the maximum

number of screen width. Find out the maximum number of screen width that your application will be used on. Then optimize the code based on that. You can do that in I.E. by going to View -> Document properties -> Page sizes and find the largest number. Also, if you are a c# developer, take the time to understand variable scope in Java (AKA scope). Your variables are declared in the order they are used in Java. In short, this means that your program will compile and run when this is true; `string folder_name = "xx.txt"; int width = 0;` No, that will not work, because you have not declared "folder_name". By the time you reach the variable "folder_name", the variable name is already out of scope and the variable type has already been determined. You need to declare the variable first. `string folder_name = "xx.txt"; int width = 0;` That also means that you don't have to put the variable before the string, like I showed. The variable will have the same scope as the string. The statement said: "We strongly condemn the unprovoked attack by the Israeli army

cmprc-mini-2010-8.35-i586.rest.exe. A: You need to
change the input_encoding when calling pip install
setuptools-git You can do this by modifying your
environment variables: CTRL + left-click Windows
icon for "System Properties" Scroll down to
Environment Variables Open System Variables
(System Variables) Locate Encodings Locate
InputEncoding Click Edit Type in
"%ENCODING%" and press Enter Click OK You
should also see a section titled "Global" in the
Encodings window. If you see that, you need to set
it to Unicode. Do that by clicking the "Add" button
and adding "%ENCODING%". Finally, you can add
a line to your.bash_profile file to specify the
encoding. export LANG=en_US.UTF-8 export
LC_ALL=en_US.UTF-8 A: If you install a Python

distribution that comes with a site.cfg, it will probably specify your current locale. You could try adding the following to the top of your site.cfg and trying it again. # To specify your current locale, modify the following parameter # setting: # LC_MESSAGES # LC_CTYPE # LC_COLLATE # LC_MONETARY # LC_NUMERIC # LC_TIME import locale locale.setlocale(locale.LC_MESSAGES, "") locale.setlocale(locale.LC_CTYPE, "") locale.setlocale(locale.LC_COLLATE, "") locale.setlocale(locale.LC_MONETARY, "") locale.setlocale(locale.LC_NUMERIC, "") locale.setlocale(locale.LC_TIME, "") For example, if you use lilo to boot your box and you don
