A diagram of the base AutoCAD Serial Key app installed on a Windows 7 system. Diagram by Kalman Garami, Foresight (www.foresight.org) Part 1: Creating the project On the first screen, click New Project. New Project lets you create a new project from scratch. Before you get to the options screen, you can save your template file (sometimes referred to as an original) and/or continue where you left off. To save your template, click Save Template, and then give the project a name. Save Template lets you save a template file for this project. This template will not be loaded in your project, and the next time you open a project, you will be asked whether you want to load the saved template. If you do not want to save the template, simply click Save Template File. Next, you can create a new project, or you can open an existing project. The Open File dialog lets you browse and select a project file. You can open an existing project from the File menu, or the Open dialog. The Open dialog is different than the Open File dialog. It is a special dialog that lets you browse and select a project or other file that is stored locally or on a network. The Open dialog appears automatically when you run the Application menu, or when you run the Open dialog manually from the Windows Explorer window. If you open a project file with an existing project, the software automatically opens the project with the last settings you used, which are stored in the.acad file. You can also import a project from a template file. Import Project lets you import a project from a template file. This method lets you start with a complete and ready-to-use project that was created and saved as a template. Enter the name of the project in the Template Name field. If your template file is in a folder, enter the folder name. Click Next. Next, you are asked to choose whether you want to use the template project as your base. The template project is an existing project saved as a template. Click Yes if you want to use the existing project as a template. Click No if you want to create a new project from scratch. You can also import a project from a template file using the File menu. You can import a project from a template file using

What's New in the AutoCAD?

Printer and Paper: Printer drivers are now automatically selected based on the print settings used for the last CAD session. This is a huge time saver and no more setting up of the printer every time you open CAD.

Improvements to AutoCAD Timing: Automatic update of the Gantt chart in the status bar when edits are made to a drawing. The Delete Window button (and the Delete command) now works in an entirely new way. It will try to

delete a whole row or column of objects by combining them into one other object. So if you delete two objects and all that happens is that you have two holes in your drawing, that's a fairly successful result. You can also combine objects together. So you could delete two lines and the resulting shape would be a filled rectangle, which is a reasonable representation of what you're trying to do. You can also drag objects (even group objects) into other AutoCAD drawings, saving even more time. And another great time saver: When you print a drawing, you can now print the associated documentation as well. Improved Evaluation Modeling: Evaluation modeling (where you make changes to your model and then evaluate the impact of the change) will now copy the current drawing as a template in the working drawing, allowing you to make changes to one drawing and copy it to another drawing. So you can take the changes made to your current drawing and apply them to a completely different model. When you're evaluating changes made to a model and you're presented with a screen that says the impact of the change on the model, you now have the option to edit the drawing right in the middle of the evaluation (the last action you were performing, in fact). And once you've made the change and saved it, it will be reflected in the model right there on the screen. When you evaluate a change, you can also add comments to that change, which will show up in the evaluation report. Comments can be very useful when you're evaluating changes. Improvements to 3D: And there's so much to this - here are just a few of the improvements: The display now automatically updates itself for rotation. So when you change the location of an object in 3D, the object will rotate to the new
