like this: foo_12345.txt I want to find that file by the name, which I am currently doing like this: for line in f: if line.rfind('foo_') == 0: file = open('%s' % line.rstrip(), "r") print file.read() Is there a more efficient way to do this? I know there is a lot of ways to do it but I

want to know how to do it in this specific case. I was wondering if it's possible to index the files so that you don't need to search the entire line. A: There's a method in os that does this for you: os.path.isfile('foo_12345.txt') That will return True if the file exists, otherwise it will return False.

for probing the functional dynamics of brain regions that are associated with psychiatric disorders. However, to date, its therapeutic value has been limited. The degree of neurocognitive impairment and associated functional deficit may be too great

to afford significant symptom improvement. Therefore, an intervention that targets emotional distress or negative cognitive bias is needed to reap the therapeutic potential of rTMS. Here we examine the scope and potential of high-frequency rTMS (HF-rTMS) to address

emotional distress. A number of studies have shown that HF-rTMS applied to a region associated with emotion regulation, the left dorsolateral prefrontal cortex (DLPFC), can induce a pattern of regional neural activity associated with enhanced cortical

function. The basis of this enhancement is unclear, and questions remain regarding its specificity, potency and durability. However, there is emerging evidence that HF-rTMS may be an effective and safe adjunct to psychotherapy in major depressive disorder
