The nuclei of the basal forebrain, those that project axons to the hippocampus, have long been recognized as important in cognitive functions. Recently, there has been a resurgence of interest in their role in memory. Although basal forebrain nuclei are by far the best known as regions of the forebrain to which the hippocampus projects, this is only the beginning of what the basal forebrain accomplishes. With numerous studies emphasizing the importance of the hippocampus and with attention to the connections between this area and the hippocampus, we concentrate on the subcortical structures that innervate the hippocampus. Here we include a brief description of the input and output connections of the hippocampal formation, with reference to the basal ganglia, thalamus, and cerebral cortex. The overall goal of this primer is to place the emphasis on the hippocampus and the neural connections between it and the basal forebrain. and thus were not located in the pathway.
