Bluej has become my weapon of choice. It's fast, easy to configure, and powerful. It's one of the most complete interpreters for Java out there. One problem I've encountered is that it's limited to the JDK. The Bluej website recommends the Sun version, but the Binaries are for the standard Bluej source code. The Binaries for the Sun version are here. You need to download the files to your hard drive and move them into the Bluej folder. Then use a command prompt to run "bluej" instead of "java". You'll have to have Java installed, but you can skip to the next part. The first tutorial is on getting started with a simple Hello World program. Bluej's documentation is easy to understand and will make you very comfortable with Java programming. At this point you can skip to the second tutorial. You'll

======================== This plugin provides you with multiple views of the Lister. Since Lister already has such views, I added a new view. The best one, in my opinion, is the Simple View, since its layout is simple and makes it easy to read code. But also the other views are useful, especially if you need to edit code. The Simple View is available from the View menu. The other views are available from the View menu, when the section is closed. If the section is closed, then the views are selected by pressing the selected item or key. If you want all of them, open the section and then do 'Select All' in the first row. ======================== CudaLister Cracked Accounts Installation: ======================== 1. Extract the files to your "TCC/plugins" folder. 2. Move "Lister.dll" from the TC/plugins/source directory to "TCC/plugins". 3. Run "Lister.reg" if you are using the default settings. 4. Run "Lister.reg" again to change the settings. 5. Restart Total Commander. ======================== CudaLister Version: ======================== 1.2.0.0 ======================== If you have any problem, please write to cuda@freak.net. Thanks for using my plugin :-) More information: ======================== New! Now with syntax highlighting and line numbering. Click on the icon below to go to the Website. **What's New in the?**

Enhance Total Commander's source code viewer. CudaLister was developed with the idea that TC is already a very powerful software, but you need a little more to make it even better. CudaLister is a plugin for Total Commander. It's not a Total Commander application in itself, rather it enhances the already existing software. What it does: It implements syntax highlighting (HTML, XML, CSS, LESS, PHP, Dart, TypeScript, SCSS, JS, Handlebars, Pluralsight, CoffeeScript, PHP, HTML, XML, Pascal, SQL, Bash, Autolt, C, C++ and more), Highlighting functionality which is a big advantage for HTML, XML and other languages, the best line numbers, a configurable and highly customizable editor with many settings, etc. Apart from the highlighting, CudaLister provides you with text wrapping, line numbers, code folding, and much more. For example, PHP has a lot of code in strings, so you usually end up with lots of single lines of code in the source code view. Using CudaLister you can easily wrap them and continue to work with the editor. Problems: Intuitive configuration of all settings is a big advantage for CudaLister. This plugin was created from scratch to solve this issue. It has so many settings that you cannot always find all the settings you need quickly, but once you find the setting of your need, you can use the configurator for one setting only - the rest of the settings will be fine-tuned in the editor. You can easily share your settings with others in the file wacthlog.txt. Can't log off the program? The only way I know of in Linux to completely shutdown a program without killing any processes (terminate the process but leave the program open) is: 1. Kill the process or terminal window with the xkill and press ctrl+c, 2. After some time press the power button. But this is not an elegant solution at all. And I know of no a similar way in Windows. I think in Windows you can't log off the program without killing the entire process. When you resize a window of Total Commander, the program will remember which window is on top, which is not as intuitive as in Windows. This can be fixed with restarting Total Commander after the window is resized. Features: 1. Syntax highlighting 2. Text
