I'm not even sure why it's only claiming to have 2GB of RAM - what I am doing with the computer is usually completely memory-starved. Is there any way I can get it to use the full 8GB? A: The system interface, i.e. the operating system and desktop environment, cannot use more than 2GB. In

Description of the Related Art With the rapid development of the Internet industry, the demand for networking of a large-capacity transmission network has increased in order to provide high-speed transmission of large amounts of information. Accordingly, the transmission of information of the Internet and the transmission of image information from a broadcasting station through a satellite have increased. In response to this need, large-capacity optical fibers have been developed, and various types of optical modulators have been developed. Modulators include a non-reciprocal optical modulator and a reciprocal optical modulator. The non-reciprocal optical modulator supports a bidirectional transmission of an optical signal, the non-reciprocal optical modulator blocks an optical signal of an optical fiber and allows an optical signal of the optical fiber to pass therethrough, and a reflector is included in

the non-reciprocal optical modulator. The reciprocal optical modulator allows the optical signal of an optical fiber to be transmitted therethrough and blocks the optical signal of the optical fiber. Thus, the non-reciprocal optical modulator may be used for access optical networks, the optical fiber may be branched to an optical element, and an optical element may be coupled to the optical fiber. The non-reciprocal optical modulator may be useful for a switching unit that passes an optical signal of an optical fiber to an optical element and blocks the optical signal of the optical fiber from passing to
